A symmetry element is a point, straight line, or plane (flat surface) with respect to which a symmetry operation is carried out. The center of mass must remain unmoved by any symmetry operation and therefore lies on all symmetry elements. When discussing molecular symmetry, we normally use a Cartesian coordinate system with the origin at the center of mass. There are five types of symmetry operation.

Molecular Symmetry I. Molecular Symmetry A. Symmetry Operations and Elements. 1. Symmetry operation = an action that leaves the object looking unchanged. 2. Symmetry element = a point, axis, or plane with respect to which the symmetry operation is performed. 3. point group = classification grouping of molecule's symmetry. E.g. H₂O belongs to group C_{2v}. 4.

The goal of much of the earlier work was the experimental determination of the symmetry of molecular states for comparison with theory, and the study of intramolecular properties of molecular crystal spectra. An important tool in these investigations was the use of polarized light to study the anisotropy of light absorption in molecular crystals.
