The Amino Revolution The Breakthrough

A light-emitting diode (LED) is a semiconductor light source that emits light when current flows through it.

Read Free The Amino Revolution The Breakthrough Program That Will Change The

Electrons in the semiconductor recombine with electron holes, releasing energy in the form of photons. The color of the light (corresponding to the energy of the photons) is determined by the energy required for electrons to cross the band gap of the semiconductor.

practically all its functions. They are large complex molecules, made up of chains of amino acids, and what a protein does largely depends on its unique 3D structure. Figuring out what shapes proteins fold into is known as the “protein folding problem”, and has stood as a grand challenge in biology for the past 50 years.
